

Artificial Intelligence in a Human World

The AI's job is *plausibility*, not truth.

The AI said it compiles, the compiler says no.

Act 1

Rules ensure intent

Rules must be *truthful to the intent* and *applied consistently*.

“Rewrite this email in a friendlier tone without changing the meaning.”

 Tools

Fast 

Rules must be *truthful* to the intent and *applied consistently*.

Visible Ink: *What* – the dialogue

*“Rewrite **this email** in a friendlier tone without changing the meaning.”*

Tools

Fast

Rules must be *truthful* to *the intent* and *applied consistently*.

Visible Ink: *What* – the dialogue

The Story: *Why* – the goal

*“Rewrite **this email** in a **friendlier tone** without changing the meaning.”*

+  Tools

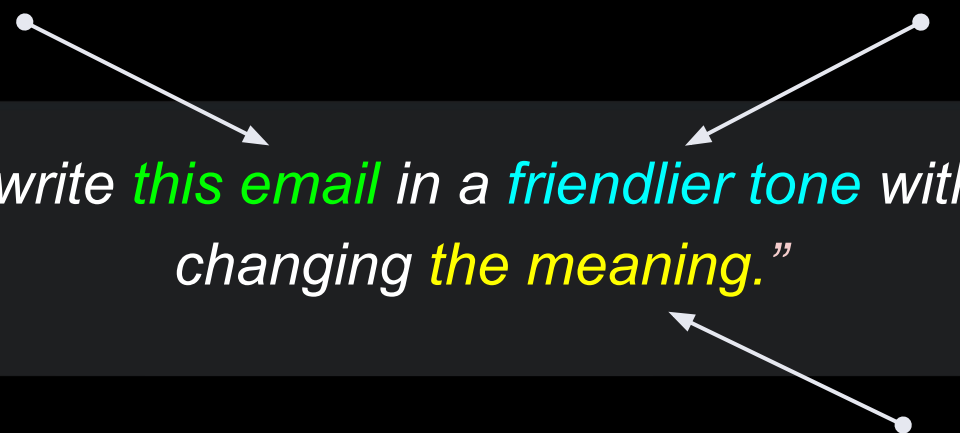

Fast ▾

Rules must be *truthful* to *the intent* and *applied consistently*.

Visible Ink: *What* – the dialogue

The Story: *Why* – the goal

“Rewrite *this email* in a *friendlier tone* without
changing *the meaning*.”

+ Tools

Fast ▾

Invisible Ink: *How* – rules & meaning

Rules must be *truthful* to *the intent* and *applied consistently*.

Visible Ink: *What* – the dialogue

The Story: *Why* – the goal

“Rewrite *this email* in a *friendlier tone* *without changing the meaning.*”

+ Tools

Fast ▾

Invisible Ink: *Don't* – be *buggy.*”

Invisible Ink: *How* – rules & meaning

Hallucination is the feature, not a bug.

LLMs are *probabilistic engines* that are *optimized* for *likely/preferred outputs*, not *guaranteed as objective truth*.

– And we *want that!*

Hallucination is the **feature**, not a bug.

*(Unless it is **factually wrong**... then it's **a smudge**)*

LLMs are **probabilistic engines** that are **optimized** for **likely/preferred outputs**, not **guaranteed as objective truth**.

– And we *want that!*

Rules need to be *observationally true* to the story.

User Journeys are Stories: (*Visible Ink*)

- Sign Up & Check Out
- Quarterly Report
- Automating Customer Service
- Analyzing large datasets to find trends

Stories have rules: (*Invisible Ink*)

- • Minimize user effort & Build trust
- • Requirements from regulatory bodies
- • A Seamless, Omnichannel Experience
- • patterns to benchmarks

Epistemics – what the model can say that is *storybound and context-limited*.

Governance – what the system can trust/act on with *deterministic, judge and receipts*.

Rules need to be *observationally true* to the story.

Rules *do not* need to be *objectively true*.

User Journeys are Stories: (*Visible Ink*)

- A Princess's journey to independence
- Protects humanity and fight for justice
- Hope comes from the most unlikely places
- Terminator; from destroyer to protector

Stories have rules: (*Invisible Ink*)

- In Disney – Animals can talk
- In DC – Superman can fly
- The one ring is evil and hobbits are pure
- What if a gun didn't want to be a gun?

Epistemics – what the model can say that is *storybound and context-limited*.

Governance – what the system can trust/act on with *deterministic, judge and receipts*.

If a superman movie turned into a batman movie, it wouldn't be a very good superman movie...

 Tools

Fast ▾

“Rewrite this email in a friendlier tone without changing the meaning.”

 Tools

Fast ▾

If a **superman** movie turned into a **batman** movie, it **wouldn't**
be a very good superman movie...

+ Tools

The Feature: *The Story/Goal*

The Translation: *The AI Alignment*

"Rewrite **this email** in a **friendlier tone** **without changing the**
meaning."

+ Tools

Fast ▾

The Translation: "Please don't be **buggy.**"

The Plausibility Paradox

The Paradox: Because probability is a *failure of governance*, you shouldn't try to "fix" the model to stop hallucinations; instead, *you must fix the boundary around it*.

The Feature

- Probability is the *engine of utility*
- When *content is aligned* to the goal
- *Plausible, story-bound* content
- *High Quality / Useful Content*

The Bug

- Probability is a *failure of governance* .
- When *content is misaligned* to the goal
- *Factually inaccurate* content
- *Low Quality / AI Smudge*

- **Visible Ink:** *“The Surface”*: What the AI says. It is the **dialogue**, the **tone**, and the **fluency**.
- **Invisible Ink:** *“The Understructure or armatage”*: The rules the AI must obey. It is the **business logic**, the **regulatory rules**, and your **specific intent**.
- **A Story:** Any process where the "Invisible Ink" (the story rules) **must govern** the "Visible Ink" (the output) to maintain trust and utility.
- **A Smudge:** The *“The Plausibility Paradox”* or **"when is hallucination a bug or not a bug?"** – When the *Visible Ink* (the *plausible* performance) bleeds through and *overwrites the Invisible Ink* (the story/business rules).

Act 2

Better boundaries

The Solver-Checker Algorithm – align intent (steps) with rules (patterns)

Steps – Protect the Intent/Narrative

- ✓ Keep the Human in the Loop
- ✓ Align AI/Human Intent
- ✓ Keep AI in the middle
- ✓ Enable Agile AI

The Solver-Checker Patterns – align intent (steps) with rules (patterns)

Rules – Protect Compliance

- Grounding
- Orchestration
- Verification
- Trust UX
- Compound learning

Grounding Pattern — "Shared Language" established before execution

WHAT: Grounding is the anchor

WHEN: Policies, rules, lore; text-to-source-of-truth

WHY: **Avoid invented facts and GIGO**

HOW: Retrieve anchors + context bundle + execution of tool + knowledge graphs + RAG + VectorDB

PROOF: Citations + "unknown" if missing

👍 Retrieve anchors + citations → say 'unknown' if missing

👎 Grounding failures are usually hidden, not obvious

Orchestration Pattern — coordinating steps in a controlled sequence

WHAT: Stepwise tool workflow

WHEN: Multi-step procedures

WHY: Prevent skipped/hidden actions

HOW: State machine + token/time budgets + rules

PROOF: "prompt engineering" to "systems engineering."

👍 It is testable, debuggable, and governable → example; accordion editing

👎 Orchestration chains add latency → keep steps minimal and set a latency budget

Verification Pattern — deterministic checks and proof of work

WHAT: Tests decide

WHEN: Binary correctness matters

WHY: **Stop plausible wrong outputs**

HOW: Deterministic judge boundary + Tools

PROOF: Pass/fail receipts

👍 Blind measure model performance objectively → If subjective, use a rubric or reference

👎 Trust vibes. Cherry-picked demos. No pass/fail receipts. Model decides without a judge

Trust UX Pattern — evidence and recovery options with user in control

WHAT: Make uncertainty explicit

WHEN: Users: approve, override, correct

WHY: **Avoid false confidence, (AI's dark triad)**

HOW: Message + receipts; explicit fallbacks

PROOF: Scope, reasons, choices made, gaps shown

👍 Evidence-based review systems improve trust in decisions

👎 Jagged frontier; silent failures, false confidence, “no receipts, but looks right”

Compound Learning Pattern — small improvements over time

- WHAT: Improve without regressions
- WHEN: Generate can be scored
- WHY: **Prevent drift, scale performance**
- HOW: Offline eval harness + scorecards
- PROOF: Score deltas, regression list, diary studies

👍 Self evaluation can drive rapid improvement → *This is far more important than most realize*

👎 Don't iterate by vibe; use fixed test sets

Solver-Checker Algorithm Recap

Algorithmic Step: (what)	Design Pattern: (how)	Reason: (why)
1. Translate	Grounding	Protects Meaning
2. Validate	Orchestration	Protects Order
3. Execute	> Classical Software_	Protects The Goal
4. Verify	Verification	Protects Execution Truth
5. Narrate	Narrate	Protects Narrative Truth
<i>0. Outside[#]</i>	<i>Compound Learning</i>	<i>Protects Progress</i>

Testing in the Loop

- Deterministic unit tests – true unit tests
- Contract tests for the model – unit-test-like, but not text-equality
- Eval regression tests – the real safety net, proof-of-work
- *Don't unit test creativity – test tools, contracts, and regressions*

AI Testing in the Loop - Practical rules

- Never let the model-judge be the only gate for correctness
- Calibrate the judges with “Golden Sets”
- Prefer pairwise ranking over absolute scoring
- Reduce correlated failure and find edge cases
- *A/B tests (Go talk to marketing!)*
- In-process testing > fire and then forget (unit tests)

AI Anti-Patterns (common pitfalls in AI development)

- | | |
|--------------------------|--|
| 1. Single-Shots prompts | <i>“One prompt, one hope.”</i> |
| 2. One prompt, one judge | <i>Grading your own papers</i> |
| 3. The “god” prompt | <i>Epistles and “thou shalt not...”</i> |
| 4. Iteration by vibes | <i>Cargo-cults – ritual inclusion that serves no purpose</i> |
| 5. Waiting for AGI | <i>AGI is asymptotic to perfect plausibility</i> |

Act 3

Proof of work

Demo 1: VAWK – AWK vibe coding

Governance – what the system can trust/act on with deterministic, judge and receipts.

1. **Grounding:** Backus-Naur Form (BNF) check
2. **Orchestration:** Propose → RAG → Run → Patch
3. **Verification:** Interpreter + tests decide
4. **Trust UX:** Receipts are visible
5. **Learning:** Regression sets

<https://github.com/dwellman/vawk>

Demo 2: A BUUI Adventure

Epistemics — what the model can say that is storybound and context-limited. (Who is allowed to say ‘this is correct.’)

1. **Grounding:** World anchored in state transition
2. **Orchestration:** One command per tick
3. **Verification:** Game engine rules decide; RAG retrieves the rulebook/state anchors.
4. **Trust UX:** State change w/ receipts
5. **Learning:** Scenario replay with eval

<https://github.com/dwellman/adventure>

Demos: A Recap 1980s-era software *now with AI!*

Pattern	VAWK (Coding/Execution Truth)	BUUI (Gaming/Narrative Truth)
1. Grounding	The Syntax: BNF Grammars & Compiler Rules.	The World-State: Player inventory & Location DB.
2. Orchestration	The Loop: Solver proposes code; Checker tests it.	The DM: Narrative engine tracks "invisible" game rules.
3. Verification	The Judge: An external Python interpreter/compiler.	The Rulebook: RAG-lookup to ensure actions are "legal."
4. Narrative	The Clean-up: Translating raw logs into a "Success" message.	The Story: Turning state changes into immersive prose.
5. Receipts	The Log: A full trace of why the code was patched.	The Game State: A reflective history of every world-state change.

Q&A

The AI's job is **plausibility**, not **truth**.

Building the boundary and injecting the facts. *That's your job.*

1. **Grounding: AI-assisted triage can notify specialists from imaging workflows.**
 - AI “parallel stroke workflow” tool and workflow timing measures. [[AHA Journals](#)]
 - LVO detection software and time-to-treatment/outcomes. [[JAMA Network](#)]
2. **Orchestration: AI-assisted stroke triage can notify specialists from imaging workflows.**
 - AI “parallel stroke workflow” tool and workflow timing measures. [[AHA Journals](#)]
 - LVO detection software and time-to-treatment/outcomes. [[JAMA Network](#)]
3. **Verification: Standardized benchmarks**
 - HELM (multi-metric benchmarking and transparency).
 - BIG-bench (broad task suite; human baselines; calibration discussion). [[arXiv:2206.04615](#)]
4. **Trust UX: Evidence-based review systems improve trust in decisions.**
 - Trust in automation review [[SAGE Journals](#)]
 - Algorithm aversion [[sol3:2466040](#)]
 - The Impact of Placebic Explanations [[eiband2019chiea](#)]
5. **Learning: Self evaluation can drive rapid improvement.**
 - Self-Refine: Iterative Refinement with Self-Feedback [[arXiv:2303.17651](#)]
 - Reflexion (self-reflection + memory improves agent performance) [[arXiv:2303.11366](#)]
 - Constitutional AI (self-critique/-revision framed as AI feedback during training). [[arXiv:2212.08](#)]

Presentation Review:

- **Thesis:** The AI's job is plausibility, not truth.
- **Keystone:** AI says it compiles. The compiler says no.
- **Patterns:** 1. Grounding, 2. Orchestration 3. Verification 4. Trust UX 5. Learning
- **Solver-Checker:** Translate → Validate → Execute → Verify → Narrate
